Convert audio to midi logic pro

Converting audio files to midi information can be an incredibly useful tool for your audio production sessions. You can use this technique to extract rhythmic or melodic content from an audio sample that you can then edit or repurpose. For example, you could extract the notation from a vocal hook, rearrange it and apply that notation to a synth or other instrument. Converting audio to midi is also wonderful if you wish to pull apart someone's compositions for study or practice. Today I'm going to show you how to convert almost any audio into midi information to use on your compositions. I've provided a simple breakdown of how to do such across most of the basic DAWs, as well as just by using your ear. It should be noted that I use these techniques on drum breaks, vocal hooks, chord progressions, and mostly organic instruments. These conversions generally work on solo-ed instruments, as it's nearly impossible to precisely extract all the midi information from an entire mix. How To Convert Audio To Midi By Hearing This method is by far the most extensive on the list, and also the most tedious. However, integrating this skill into your production game will definitely give you a musical advantage as it trains you to be a better listener. Solo the instrument that you would like to extract midi from. For this example, I'm going to use a synth lead line. Try to play along with the part using a midi piano or other simple instrument. You can slow the song down if the part is too complex. Once you're able to perform the piece you need, simply record a take-off you playing alongside the soloed instrument. Open up your piano roll at the bottom of your DAW and you should be able to see each note that you've played mapped out for you to tweak and rearrange. You can use the piano roll to fix any mistakes you might have made while recording. How To Convert Audio To Midi In FL Studio Drag and drop the audio that you want to extract into a track in arrangement mode. Left-click on the corner of the sample to reveal a dropdown menu. Select the 'Edit sample' option under the Sample section in this menu. This action will open up Edison, which is FL Studio's audio sample editing tool. Select the relative pattern and channel that you would like your notes to appear in. Right-click anywhere on the sample in Edison and another dropdown will appear. Select 'Convert to score and dump to Piano Roll' under the Tools section. The notes of the selected audio should now appear on a fresh piano roll in a new track for you to utilize. How To Convert Audio To Midi In Cubase Drag and drop the audio that you want to extract into a track in arrangement mode. Double click on the sample to open up the primary sample editor used in Cubase. On the left-hand side of this window, you should find a menu with a few tabs. Select 'Edit Variaudio' under the Variaudio tab. Your audio should immediately be converted to a piano roll with all the notation laid out for adjustments. Click on the Functions tab and select 'Extract Midi' in the dropdown. The Variaudio menu also has a handful of quick editing tools like pitch quantization and curve straightening that you can use to further adjust your midi conversion. How To Convert Audio To Midi In Ableton Drag and drop the audio that you want to extract into a track in arrangement mode. Right-click on the sample to bring up a dropdown menu. Select the Convert Audio To Midi option in this dropdown menu. There are three conversion options to select from in Ableton: Melody (for monophonic sounds), Harmony (for chords), and Drums. Select the option relative to the file you're converting. Ableton will turn the audio channel into a midi track with your notes laid out on a piano roll for adjustments or tweaking. How To Convert Audio To Midi In Logic Pro Drag and drop the audio that you want to extract into a track in arrangement mode. Either double click on the desired sample or press E on your keyboard to open up the sample editing tool. At the top-left-hand side of the editor, you'll see a DNA-shaped symbol for Flex Pitch. Turn this setting on before converting your audio. You should see some blue square-shaped notes around the transients of your audio sample. Click on the Edit tab at the top-left corner of the editor's window. Select Create Midi Track from Flex Pitch data. Logic will create a new channel with your converted midi files laid out on a piano roll for you to edit and adjust. How To Convert Audio To Midi In Pro Tools Drag and drop the audio that you want to extract into a track in arrangement mode. Create a new stereo track for the audio you want to be converted. Drag the audio you want to convert into this new stereo track. An Audio to Midi menu should pop up at the center of the screen. There are various conversion options in this menu - ranging from percussive and melodic to polyphonic and universal. Select the most appropriate option for your audio file. Your audio will be converted to a new midi channel where you can select an instrument to apply the notation to. Final Thoughts Converting audio to midi is a relatively new tool in the world of mixing and producing. You're not always going to get the most accurate conversions all the time, but more often than not you can capture the crucial musical parts of a sample. Midi information can also be used for other exciting performance-based techniques like triggering and automation, so I highly encourage you to explore all the possible midi functions your DAW provides. Do you want to learn a bit more about how to improve your production game? Check out our quick guide on How To Mix Your Beats in 6 Steps. We've laid out some pretty simple and handy tips and examples that should give a healthy boost to your mixing skills. Thanks for reading through our guide on How To Accurately Convert Audio To Midi. Select version: Logic Pro 10.7.3 Logic Pro 10.7 Logic Pro 10.6.2 Logic Pro 10.6 Logic Pro X 10.5 Modifying this control will update this page automatically Welcome Get started with Logic Pro Record your voice or a musical instrument Use loops and other media files Edit audio regions in the Audio Track Editor Edit MIDI regions in the Piano Roll Editor Add drummers to your project Edit the timing and pitch of audio Automate mix and effects settings Edit global project settings Create a musical score in Logic Pro Overview Add notes Add notes and symbols from the Part box Edit notes in the Score Editor Use automation in the Score Editor Edit score region parameters Create scores and parts using score sets Share a score Customize the Score Editor Video and synchronization Preferences, project settings, and key commands Touch Bar shortcuts Use Control Surfaces with Logic Pro Instruments introduction Utility instruments External Instrument Klopfeist Vintage Mellotron overview Vintage Mellotron controls Glossary Copyright You can create MIDI regions from audio regions in an audio track with Flex Pitch activated. This "audio-to-MIDI" capability can be used to double the audio regions using a different instrument or different effects, to modify the sound of the original audio recording, to notate the music, and for other purposes. Creating MIDI regions from an audio recording works best with monophonic material; chords or polyphonic material may lead to errors in interpretation. Before creating the MIDI regions, it's a good idea to make any needed corrections to the audio after enabling Flex. This could include timing corrections, missing or incorrectly pitched notes, and other corrections. After creating the MIDI regions, you can make further corrections and changes to the MIDI notes. When you use the Create MIDI Track from Flex Pitch Data command, a MIDI region is created for each audio region on the audio track. In Logic Pro, double-click the audio region in the Tracks area to open the Audio Track Editor. Click the Show/Hide Flex button in the Audio Track Editor menu bar. Choose Flex Pitch from the Flex Mode pop-up menu in the Audio Track Editor menu bar. After making any needed corrections, choose Edit > Create MIDI Track from Flex Pitch Data in the Audio Track Editor menu bar. A new instrument track appears in the Tracks area below the audio track, containing MIDI regions created from the Flex Pitch data of the regions on the audio track. Choose a patch for the new track from the Library. After creating a new MIDI region, you may want to play it together with the original audio recording to hear any inaccuracies, then make corrections to MIDI notes, adjust their velocity, quantize the region, or perform other edits in the Piano Roll Editor. You can also open the region in the Score Editor to view MIDI notes as music notation. Helpful? Thanks for your feedback.
